Bachelor of Computing Program

The Bachelor of Computing program is designed to provide students with a strong foundation in computing and software development. The program covers programming, database systems, computer networks, software engineering, and information systems.

Students are expected to develop both theoretical knowledge and practical skills throughout the program.

Practical coursework is included in several modules to help students apply the concepts learned during lectures.

Students are required to complete an industrial training period as part of the program. The training provides students with an opportunity to apply their technical knowledge in a professional working environment. During the training period, students are expected to participate in software development activities and follow the procedures of the organization where they are placed.

Students must maintain appropriate documentation of their training activities and submit the required documents before completing the program.

The assessment process consists of examinations, assignments, practical activities, and project work. Each module may use a different combination of assessment methods depending on its learning outcomes.

Students are expected to complete their assignments within the deadlines specified by the institute. Failure to submit an assessment within the required period may affect the student's final grade.

The institute provides several facilities to support students during their studies. The computer laboratories contain the hardware and software required for practical sessions. Students can access the laboratories during the scheduled practical sessions and other permitted periods.

The library also provides access to textbooks, reference materials, and digital learning resources. The library is open from 8:00 AM to 5:00 PM on weekdays.

Students must complete the registration process before starting a new academic semester. Registration requires students to provide the required academic and personal information to the administration.

Students may also be required to settle applicable academic fees before their registration is confirmed. Any changes to registration information should be reported to the administration as soon as possible.

The institute encourages students to participate in extracurricular activities and student societies. These activities provide opportunities for students to develop communication, teamwork, leadership, and organizational skills.

Students may participate in technical events, workshops, competitions, sports activities, and other approved programs.

Participation in these activities is voluntary and does not replace the academic requirements of the program.
